

# 12v is converted to 100v through the inverter

## Overview

---

The top side of the circuit says “+12V to +100V DC” — this means input can be any voltage from 12V to 100V. That high voltage passes through a 10k, 1 watt resistor, then to the Zener diode (12V). The Zener clamps the voltage to exactly 12V, and the MJE340. I am looking to power a phone ringer circuit that requires +100 V DC and a -100 V DC. Is it possible to get +/-100 V DC from 12 V DC without a transformer?

If a transformer is the best option then I will use the. Gives stable 12V to ICs even if input DC is high. Helps reset and invert signals properly. It is designed for you that need to use appliances outdoor or no electricity. It can be converted 12VDC to 220VAC. The maximum output power about. This is actually a oscillating circuit, which turns the DC power into AC power, then turns it into 220V through the transformer boost, and then connects the electrical device to the output terminal, but the inverter made by these components.
