## Overview

---

I've tested 23 different portable power banks over the past six months, and I need to be honest with you right from the start: most of them lie about their capacity. Their performance is defined by their internal battery capacity, measured in watt-hours (Wh) or milliamp-hours (mAh), and their output power, measured in watts (W). Solar Power Banks: This term can be ambiguous, as it generally refers to two distinct product categories: Integrated Solar Chargers: We expect to fully charge our iPhone 17/16/15/14/13 with about 3,500 mAh battery a minimum of 3 times using a 10,000mAh power bank as  $3,500 \times 3 = 10,500$ . After draining, charging, and measuring the actual output of everything from budget \$20 models to premium \$150. Power banks are portable devices designed to charge electronic devices by storing electrical energy in a built-in battery.
