

How is Leapmotor s new energy storage

Overview

Chinese EV maker Leapmotor, backed by Stellantis, has begun supplying self-developed battery packs—built by subsidiary Lingxiao Energy using cells from CATL and others—to more than five commercial vehicle customers, including talks with Xeazon for pure-electric mixer trucks. Leapmotor's battery cells are still sourced from battery makers including CATL. The company purchases the cells. The aim is to achieve greater vertical integration of the supply chain, it says, following the example of China's market leader BYD. As reported by Leapmotor has revealed its innovative Leap Mat charging device that allows users to top-up their car battery anytime and anywhere. Available to order from the start of April, this cutting-edge device converts physical movement into electrical energy for convenient and cost-effective charging. Units of Swiss battery packs manufacturer LION E-Mobility and Chinese automotive manufacturer Leapmotor Technology have teamed up to develop and market energy storage solutions in the fields of electric mobility and stationary battery storage.
