

Length of the photovoltaic bracket beam

Overview

Which is the length of the solar bracket?

The length of a solar bracket varies based on its design, application, and the specific requirements of the solar panel system. Standard dimensions typically range between 3. The optimized main beam adopts a section height of 100mm, a section width. the flat single-axis tracking bracket structure is a plurality of columns supporting a full-length main beam, and the photovoltaic components are installed above the main beam and rotate around the axis with the center of the main beam as the axis. In this structural form, since the photovoltaic. This type of mounting is the more used form of bracket in the early photovoltaic project. The bracket is set up with long and short legs before and after the bracket, and the legs are bolted to the foundation respectively, one end of the diagonal brace is supported at the foot of the long column.
