Overview

Most solar panels are dark blue or black in hue. Outside of very niche applications where solar cells and panels can actually be tinted specific colors (usually with a significant hit to efficiency), solar panels typically come in three basic designs: white, black, and transparent (aka bifacial). This color variation is caused by how light interacts with two distinct kinds of solar panels: monocrystalline and polycrystalline. Black, blue, gray, even semi-transparent. each color tells a story. It's about the material inside, how it reflects or absorbs sunlight, and even the cost.

Normal color of solar panels
