

# Oilfield photovoltaic panel power generation principle

## Overview

---

This innovative approach uses concentrated solar power to generate high-pressure steam for oil extraction, reaching temperatures up to 750°F (400°C) and pressures of 2,500 PSI. The process employs enclosed trough technology, housing lightweight mirrors within greenhouse-like. The Photovoltaic is one of the important development directions of new energy development, and its development is of great significance for optimizing the energy structure and achieving the goal of “double carbon”. With the rapid development of the green low-carbon circular development economic. The Oil and Gas Climate Initiative is a CEO-led organization bringing together 12 of the largest oil and gas companies worldwide to lead the industry's response to climate change. Regardless of whether it is used independently or connected to the grid, the photovoltaic power generation system is mainly composed of three. special field applications. Foremost among these applications are the off-grid warning light els in oil field operations. PV panels were used to provide power to oil pumping e power to production sites. This integration represents a significant shift in how traditional energy companies approach their power needs. Solar technology helps oil.
