

# Photovoltaic panel output curve explanation

## Overview

---

Photovoltaic modules consist of interconnected cells, and their output characteristics are represented in an I-V curve. The I-V curve contains three. The Solar Cell I-V Characteristic Curves shows the current and voltage (I-V) characteristics of a particular photovoltaic (PV) cell, module or array. It gives a detailed description of its solar energy conversion ability and efficiency. It is also used to determine important parameters such as the open-circuit voltage (Voc), the short-circuit current (Isc), the maximum power point. Solar PV cells convert sunlight into electricity, producing around 1 watt in full sunlight.
