

Photovoltaic panels are not connected to the grid inverter

Overview

If a solar panel is not connected to an inverter, the produced DC (direct current) power from the solar panels cannot be converted into AC (alternating current) power. This extra electricity can lead to overheating and cause the voltage across the panel to be converted into heat. This can potentially lead to a fire hazard if solar panels are. Professional Installation is Critical: Grid-tied solar systems require licensed electricians and multiple permits, with the interconnection process typically taking 2-8 weeks and costing \$200-\$2,000 in fees alone. It is a safety feature called anti-islanding. It doesn't just convert energy—it actively syncs your solar system with your utility provider. In this quick guide, we'll break down how that sync happens and why it matters for your setup.
