

Photovoltaic power generation and energy storage function

Overview

Photovoltaic cells harness sunlight, 2. The AES Lawai Solar Project in Kauai, Hawaii has a 100 megawatt-hour battery energy storage system paired with a solar photovoltaic system. Sometimes two is better than one. The reason: Solar energy is not always produced at the time. Solar energy can be harnessed two primary ways: photovoltaics (PVs) are semiconductors that generate electricity directly from sunlight, while solar thermal technologies use sunlight to heat water for domestic uses, to warm buildings, or heat fluids to drive electricity-generating turbines. Some PV cells can convert artificial light into electricity. Sunlight is composed of photons, or particles of solar energy. The total amount of solar energy received on Earth is vastly more than the world's current and anticipated energy requirements.
