

Pull-out strength of photovoltaic bracket

Overview

This document provides formulas and examples for calculating the pullout strength of anchor bolts embedded in concrete or epoxy. Rock bolts are one of the main measures used to reinforce unstable blocks in a rock mass. With solar installations increasing by 18% annually since 2023, the structural integrity of photovoltaic (PV) brackets has become a critical safety concern. Imagine a 10MW solar farm in Texas losing 15% of its panels during a storm – that's exactly what happened last month due to inadequate. The invention discloses a pull-out test method and a pull-out test device for a photovoltaic bracket anchor-pulling structure, which relate to the technical field of construction, and the method comprises the following steps: manufacturing a pulling anchor plate; manufacturing a pulling plate;. Anchor load tests, or pull-out tests, are a key method in photovoltaic installations, especially in the construction of ground-mounted solar power plants. These tests focus on verifying the stability and load-bearing capacity of panel anchoring in the field, which is essential to ensure resistance. testing machine with a maximum force of 50 kN. The module frame or mounting points shall be grounded. The modules shall be at temperature before relative humidity is ramped and voltage shall be applied for the test duration after testing machine from Zwick's Allround series.
