

# Salt cavern air energy storage system

## Overview

---

The project, which comprises two 300 MW non-combustion compressed air energy storage units, works by compressing air and injecting it into the salt caverns during periods of low demand. The stored air is then released during peak demand to drive turbines and generate electricity. During compression, the air is cooled to improve the efficiency of the process and, in case of underground storage, to reach temperatures comparable to the. Compressed Air Energy Storage (CAES) operates on a straightforward principle: excess electricity is used to compress air, which is then stored in underground formations. Often aspects of CAES design can be divorced from each other, this thesis attempts.
