

Solar thermal power generation and energy storage research and development

Overview

NLR is advancing concentrating solar-thermal power (CSP)—along with integral long-duration thermal energy storage—to provide reliable heat for industrial processes and firm electricity. CSP uses a large array of reflectors to concentrate the sun's rays and convert them into. The objective of SI 2030 is to develop specific and quantifiable research, development, and deployment (RD&D) pathways to achieve the targets identified in the Long-Duration Storage Shot, which seeks to achieve 90% cost reductions for technologies that can provide 10 hours or longer of energy. Thermal energy storage (TES) technologies are emerging as key enablers of sustainable energy systems by providing flexibility and efficiency in managing thermal resources across diverse applications. CSP uses a large array of reflectors to concentrate the sun's rays and convert them into high-temperature heat. Thermal storage plays a crucial role in solar systems as it bridges the gap between resource availability and energy demand, thereby enhancing the economic viability of the system and ensuring energy continuity during periods of usage.

Technology Strategy Assessment

Modern TES development began with building heating and cooling and concentrated solar thermal technologies for power generation in the early 1900s and late 1970s, respectively [1].

Comprehensive review of emerging trends in thermal energy storage

This review aims to synthesize current knowledge while identifying pathways for accelerating the development and practical deployment of next-generation TES technologies.
