

The wind temperature of the generator is high on one side

Overview

For air-cooled generators in regions regularly exceeding 100°F (38°C), consider upgrading to liquid-cooled models which offer superior heat management during extended operation. High temperatures can put a strain on a generator's engine. When temperatures rise, the engine's components, including the coolant and oil, may not function as efficiently, leading to reduced performance and possible. : Generators have an optimum operating temperature range. If the temperature outside the generator exceeds this range, it can cause overheating which not only causes malfunctioning, but fire can hazard as well effects on the overall functionality of a generator. Heat, cold, humidity, and dust storms are all problems. If excessive ambient temperature flowing through a wire meets resistance which manifests itself as heat.
