Overview

Herein, a one-step and efficient method for bamboo-based ISSG combines solar-powered steam generation and solar-powered desalination with reduced manufacturing. Bioenergy is energy or electricity made by processing organic wastes, including agricultural residues, wood wastes, animal manure, and yes, bamboo. Biomass power plants use thermal conversion processes to turn biomass wastes into electricity and heat. Its fast growth cycle, aided by the capacity to regenerate without replanting, makes it a sustainable and renewable resource. Furthermore, bamboo cultivation requires minimal water. We use a simple surface self-assembly technique to load polypyrrole (PPy) onto bamboo to make solar evaporation devices. However, it is d absorptionin the UV-vis-NIR region. The PPy-bamboo solar evaporation device can get a high photothermal conversion efficiency of 76. 8 bamboo for solid biofuel production. This thesis report analyses and calculates the stress and deformation on these reinforced bamboo beams when used as a roof.
